

SOSC 300
Activity 3B
Quantifying a Variable

Examine the data set made in class that shows political orientation of parents, income, guessed scores, calculated scores, and hometown sizes. Create one graphic from the data that connects any of the columns of data to political scores.

For example, you could say that liberal parents produce children who THINK they are liberal (guessed scores are liberal), but who actually have conservative scores from the questionnaire. Then show data to support that assertion.

Have fun with it, and be creative, and let the data do the talking with the support.

This is due September 28th in class.
